Process & Decision Documentation

Project/Assignment Decisions

In this side quest, I was tasked with adding a new debug system to my previous work. I chose to follow the examples from class as a basis for what I needed to include in my debug screen and how it should look.

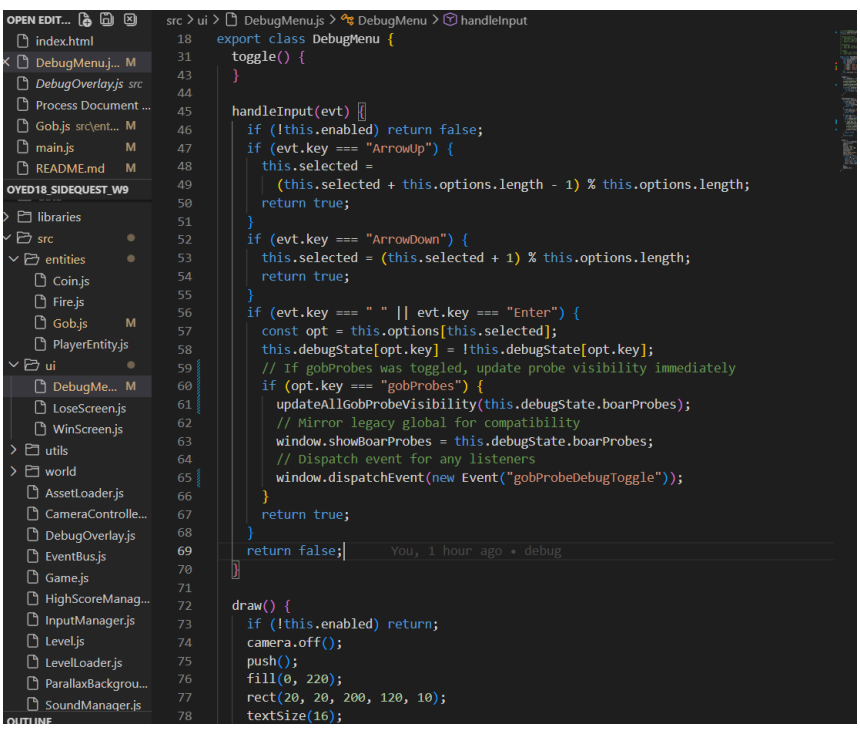
Side Quests and A4 (Individual Work)

Keep this section brief, typically 2 to 4 sentences.

Focus on:

- I changed the order of the labels
- I did it because it made more sense for me to arrange them in the order of what I would use the most.

Role-Based Process Evidence



GenAI Documentation

Date Used: 23rd of March 2026

Tool Disclosure: Claude Sonnet 4.6

Purpose of Use: I used it to check why my code wasn't working.

Summary of Interaction: I used it to check my files to see why my code wasn't responding when I ran it.

Human Decision Point(s): After it showed me what was wrong, I went back and fixed the issues it suggested.

Integrity & Verification Note: I made sure it was only my original code that it used.

Scope of GenAI Use: I used the tool to check why my code wasn't showing anything on screen when I ran it.

Limitations or Misfires: None, the interaction was pretty straight forward so it gave me my issue and I left it at that.

Summary of Process (Human + Tool)

- Iteration between drafts or versions
- Testing and revision
- Rerunning the code

Appendix

Prompt:

"can you check why the screen is blank when I try to run this code? | Main.js | DebugMenu.js | "

Output:

Can you open the browser console (F12 → Console) and paste the red errors you see? That'll tell us exactly what's failing.

My best guess is:

The `Gob.js` import in `DebugMenu.js` — the file imports `updateAllBoarProbeVisibility` from `"../entities/Gob.js"`. If that file doesn't exist at that path or isn't exported, it'll crash the whole module and cause a blank screen.

Check your console and paste the errors — that'll confirm what it is.

Prompt:

“it shows ?

```
Uncaught SyntaxError: The requested module                    DebugMenu.js:2
'../entities/Gob.js' does not provide an export named
'updateAllBoarProbeVisibility' (at DebugMenu.js:2:10)
```

| Gob.js |”

Output:

That means `Gob.js` doesn't export a function called `updateAllBoarProbeVisibility`. You need to either add that export to `Gob.js`, or if boar probes aren't something you need, just remove that import and the two lines that call it in `DebugMenu.js`.

The simplest fix — since you probably don't need boar probes right now — is to strip that dependency out of `DebugMenu.js` entirely:

Ran 3 commands, edited a file
Ran 3 commands, edited a file

Good — the import and function calls are gone. The remaining references are just the menu label and a `window.showBoarProbes` flag, which are harmless. Let me verify the file looks clean:

Verify final DebugMenu.js
Verify final DebugMenu.js

Looks clean. Copy to outputs:

Ran a command, read a file
Ran a command, read a file

Replace your `src/ui/DebugMenu.js` with this. The fix was removing the `import { updateAllBoarProbeVisibility }` line and the two places it was called — since your project

uses `Gob.js` and doesn't export that function, the import was crashing the whole module before anything could load.

Two files to replace — `src/entities/Gob.js` and `src/ui/DebugMenu.js`. Here's what needs to be changed:

`Gob.js` — Two fixes: add the `updateAllBoarProbeVisibility` export that `DebugMenu` needs, and fix the tuning property paths to use the nested structure your `tuning.json` actually has (e.g. `b.collider?.w` instead of `b.w`, `b.move?.speed` instead of `b.speed`). The flat paths in the old `Gob.js` meant boar speed, HP, and knockback were all falling back to hardcoded defaults instead of reading from your tuning file.

`DebugMenu.js` — Restored the import pointing to `Gob.js` and the two `updateAllBoarProbeVisibility` calls that were stripped out in the previous fix.

| DebugMenu.js |
